Project Title:

Prediction of start ups success using Machine learning Algorithm

Name: K. Pranavi

Roll No:20X01A0584

Year: 4th Year

Project Guide Name: Mr. Lokesh B Sir

Problem Statement

According to the world survey records for 50 startup companies including their profit and loss, as a machine learning specalist my task is that predict the success rate in future

Importing the libraries

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
```

Importing the dataset

```
dataset=pd.read_csv("50_Startups.csv")
x=dataset.iloc[:,:-1].values
y=dataset.iloc[:,-1].values
print(x)
     [[165349.2 136897.8 471784.1 'New York']
      [162597.7 151377.59 443898.53 'California']
      [153441.51 101145.55 407934.54 'Florida']
      [144372.41 118671.85 383199.62 'New York']

```

Encoding categorical data

```
from sklearn.compose import ColumnTransformer
from sklearn.preprocessing import OneHotEncoder
ct=ColumnTransformer(
    transformers=[
          ("endcoder",OneHotEncoder(),[3])
```

```
remainder="passthrough"
x=np.array(ct.fit_transform(x))
print(x)

```

Splitting the dataset into the Training set and Test set

```
from sklearn.model_selection import train_test_split
x_train,x_test,y_train,y_test=train_test_split(x,y,test_size=0.2,random_state=0)
```

Training the Multiple Linear Regression model on the Training set

```
from sklearn.linear_model import LinearRegression
regressor=LinearRegression()
regressor.fit(x_train,y_train)

v LinearRegression
LinearRegression()
```

Predicting the Test set results

Accuracy of Tain and Test data

```
print("Train Score",regressor.score(x_train,y_train))
    Train Score 0.9501847627493607
print("Test Score",regressor.score(x_test,y_test))
    Test Score 0.9347068473282546
```

Result:

According to my model selection Mutiple regression model gives 95% accuracy and 5% precision which is worst in machine learning range.
